File Organization Technique- Single and Two level directory

AIM:

To implement File Organization Structures in C are

a. Single Level Directory
b. Two-Level Directory
c. Hierarchical Directory Structure
d. Directed Acyclic Graph Structure

a. Single Level

Directory

ALGORITHM

1. Start
2. Declare the number, names and size of the directories and file names.
3. Get the values for the declared variables.
4. Display the files that are available in the directories.
5. Stop.

PROGRAM:

```
#include<stdio.h>
#include<stdlib.h>
#include<graphics.h>
Void main()
{
int gd=DETECT, gm, count, i, j, mid, cit-x;
char fname[10][20];
clear device();
set bk color(Green);
Puts("Enter number of files");
Scanf("%d", &count);
```

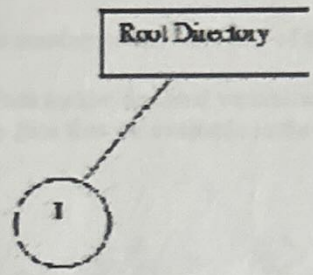
```
for(i=0; i<count; i++)
{
  cleardevice();
  setbkcolor(GREEN);
  Printf("Enter the file name", i+1);
  Scanf("%s", frame[i]);
  Setfillstyle(1, MANAGEMENT)
  mid = 640/count; cir_x = mid/3;
  bar3d(270, 100, 370, 150, 0, 0);
  Settextstyle(2P, 4);
  Settextjustify(1, 1);
  Outtextxy(320, 125, "ROOt directory");
  Set colour(BLUE);
  for(j=0; j<=i; j++, cir_x += mid)
  {
    line(320, 150, cir_x, 250);
    fillellipse(cir_x, 250, 30, 30);
    Outtextxy(cir_x, 250, frame[j]);
  }
}
```

OUIPUI:

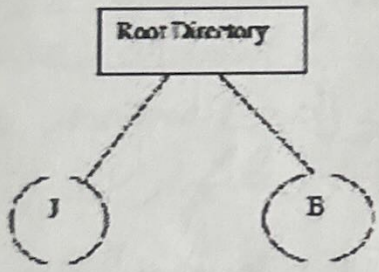
Enter the Number of files

2

Enter the file1 J



Enter the file2 B



b. Two-level directory Structure

ALGORITHM:

1. Start
2. Declare the number, names and size of the directories and subdirectories and file names.
3. Get the values for the declared variables.
4. Display the files that are available in the directories and subdirectories.
5. Stop.

PROGRAM:

```
#include<stdio.h>
#include<graphics.h>
struct tree_element{
    char name[20];
    int x, y, file, lx, rx, nc, level: struct tree_element *link;
};
typedef struct tree_element node;
void main(){
    int gd=DETECT, gm; node *root;
    root=NULL;
    create(root, 0, "null", 0, 630, 320);
    clrscr();
    initgraph(&gd, &gm, "C:\\tc\\bgi");
    display(root);
    getch()
    closegraph();
}
```

```
create(node **root ; int lev, char * d_name, int (* int rx)
{
  int i, gap;
  if (*root = NULL)
  {
    (*root)=(node*) malloc(sizeof(node));
    Printf("Enter name of dir/file (node 1.5):
    flush(stdin)
    gets(*root)->name);
    if (lev=0 || lev==1)
    (*root)->ftype=1;
    else
      (*root)->ftype=2;
      (*root->level = lev;
      (*root)->x = x;
      (*root)->lx = lx;
      (*root)->rx = rx;
    for((*root)->ftype==1)
    {
      if (lev==0||(lev==1)
      {
        if ((*root;->level==0)
        Printf("How many users");
    else
      Printf("How many files");
      Printf(for i:5): (*root)->name);
      Scanf("i.d", &*(root->nc);
    }
    else
    (*root)->nc=0;
    }
    }
    display(node* root)
```

```
if (root != NULL)
{
  for (i=0;i<root->he;i++)
  line (root->x, root->x, root->link[i]->y)
}
if (root->x, root->y, root->link[i]->y);
filellipse (root->x, root->y, 20, 20);
outtextxy (root->x, root->y, root->name);
for (i=0;i<root->nc;i++)
{
  display (root->link[i]);
}
}
```

Sample Output:

```
Enter the name of dir/file(under null): Hai
How many users(for Hai):1
Enter name of dir/file(under Hai):Hello
How many files(for Hello):1
Enter name of dir/file(under Hello):welcome
```

Result: Thus the file organization technique single and two level directory are executed successfully
